Assignment No.: 3

Building a Dashboard

Problem Statement

A retail company relies on manually prepared reports to monitor business performance. Develop a Power BI dashboard showing sales, revenue, profit and product performance.

Methodology / Steps Followed

Step 1: Data Collection

- Obtained Sales and Product Data from CSV/Excel files.
- Connected to MySQL Server and obtained additional data from the database.

Step 2: Data Import

- Opened Power BI Desktop.
- Imported the required CSV and Excel datasets using the Get Data option.

- Connected Power BI with the MySQL Server to access the required data.

Step 3: Data Modeling

- Used the available Sales and Product data for analysis.
- Created the required data structure for developing the dashboard.

Step 4: DAX Measures and KPI Creation

- Created new measures using DAX functions.
- Created measures for Average Product Price, Average Product Cost, Average Profit, and Profit Margin.
- Used the measures to create KPI visuals in the dashboard.

```
1 Average Product Cost =  
2 AVERAGE(Assignment1[ProductCost])
```

 

```
1 Average Profit =  
2 AVERAGEX(  
3     Assignment1,  
4     Assignment1[ProductPrice] - Assignment1[ProductCost]  
5 )
```

Step 5: Dashboard Development

- Created KPI visuals for Average Product Price, Average Product Cost, Average Profit, and Profit Margin.
- Developed charts to analyze product data by month and product color.
- Added a line chart to show product count by month.
- Added a pie chart and column chart to analyze products by color.
- Designed an interactive business dashboard for product analysis.

Output

The final Power BI dashboard provides:

- Average Product Price Analysis
- Average Product Cost Analysis
- Average Profit Analysis
- Profit Margin Analysis
- Monthly Product Count Analysis
- Product Color Analysis
- Interactive Dashboard Visuals

The dashboard enables users to analyze product performance and understand pricing, cost, and profitability effectively.

Conclusion

This project successfully combined data from different sources and integrated it into Power BI for effective analysis. The available data was connected, organized, and modeled to generate useful insights. DAX measures were created to calculate key metrics such as average product

price, cost, profit, and profit margin. The developed dashboard presents these insights in a simple and interactive manner, helping users understand product performance and support better decision-making.

Learning Outcomes

Through this project, I learned:

- How to import data from CSV and Excel files into Power BI.
- How to connect Power BI with a MySQL Server and access database data.
- How to use existing cleaned data for analysis and dashboard development.
- Creating DAX measures to calculate average product price, product cost, profit, and profit margin.
- Creating and using KPI visuals and different charts for product analysis.
- Designing an interactive Power BI dashboard using different visualizations.
- Analyzing product data and generating meaningful insights from the available data.
